A madgard 2.1.

A madgard and a more explained by defects in Fas antigen that mediates apoptosis.";

A matigen that mediates apoptosis.";

L Nature 356:134-317(1992).

C -!- FUNCTION: Receptor for TNFSF6/FASL. The adaptor molecule FADD recruits caspase.8 to the activated receptor. The resulting death-inducing signaling complex (DISC) performs caspase.8 proteolytic activation which initiates the subsequent cascade of caspasas.

C aspartate-specific cysteine proteases) mediating apoptosis. FAS-caspared apoptosis may have a role in the induction of peripheral tolerance, in the antigen-stimulated suicide of mature T-cells, or both (By similarity).

C --- Subsclidura Locatron: Type I membrane protein.

C --- TISSUE SPECIFICITY: DETECTED IN VARIOUS TISSUES INCLUDING THYMUS, LIVER, LUNG, HEART, AND ADULT OVARY.

C --- DOMAIN: CONTAINS A DEEATH DOMAIN INVOLVED IN THE BINDING OF FADD, AND MAYBE TO OTHER CYTOSOLIC ADAPTOR PROTEINS.

C --- DISEASE: DEFECTS IN THRESFG ARE THE CAUSE OF A LYMPHOPROLIFERATION PROTEINS.

C --- DISEASE: DEFECTS IN THRESFG ARE THE CAUSE OF A LYMPHOPROLIFERATION PROTEINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This SWISS-PROT entry is copyright. Biophys. Res. Commun. 198:666-674(1994).

-I- FUNCTION: Receptor for TNFSF6/FASL. The adaptor molecule FADD recruits caspase-8 to the activated receptor. The resulting death-inducing signaling complex (DISC) performs caspase-8 proteolytic activation which initiates the subsequent cascade of caspases (aspartate-specific cysteine proteases) mediating apoptosis. FAS-mediated apoptosis may have a role in the induction of peripheral tolerance, in the antigen-stimulated suicide of mature T-cells, or

SUBCELLULAR LOCATION: Type I membrane protein.
DOMAIN: CONTAINS A DEATH DOMAIN INVOLVED IN THE BINDING OF FADD,
AND MAYBE TO OTHER CYTOSOLIC ADAPTOR PROTEINS.
SIMILARITY: CONTAINS 3 TWER-CYS REPEATS.
SIMILARITY: CONTAINS 1 DEATH DOMAIN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        DEATH.

CC Tecrults caspase-8 to the activated receptor. The resulting deathing signaling complex (DISC) performs caspase-8 proteolytic activation which initiates the subsequent cascade of caspases (aspartate-specific cysteine proteases) mediating apoptosis. FAS-CC activated apoptosis may have a role in the induction of peripheral tolerance, in the antiqen-stimulated suicide of mature T-cells, or both. The secreted isoforms 2 to 6 block apoptosis (in vitro).
CC Secreted (isoforms 2 to 6).
CC -I- SUBCELLUAR LOCATION: Type I membrane protein (isoform 1); Secreted (isoforms 2 to 6).
CC -I- SUBCELLUAR PRODUCTS: 6 isoforms; 1 (shown here), 2/Del2/d, solicing solicing and 6/TMDel/a; are produced by alternative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This SWISS-PROT entry is copyright. ** POTENTIAL.
inducing signaling complex (DISC) performs caspase-8 protectolytic activation which initiates the subsequent cascade of caspases (aspartate-specific cysteine proteases) mediating apoptosis. FAS-mediated apoptosis may have a role in the induction of peripheral tolerance, in the antigen-stimulated suicide of mature T-cells, or SUBCELULAR LOCATION: Type I membrane protein.

DOWAIN: CONTAINS A DEATH DOMAIN INVOLVED IN THE BINDING OF FADD, SIMILARITY: CONTAINS 3 THER-CYS REPEATS.

SIMILARITY: CONTAINS I DEATH DOMAIN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             54 FCCQPCQPGKKKVEDCKMNGGTPTCAPCTEGKEYMDKNHYADKCRRCTLCDEEHGLEVET 113

the KILLER/DR5 tumor necrosis factor-related apoptosis-inducing ligand
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          receptor. The resulting death-inducing signaling complex (DISC) performs caspase-8 proteolytic activation which initiates the subsequent cascade of caspases (aspartate specific cysteine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Nakamura'r., Tamari M., Watanabe O.;
"Mouse TRAIL receptor.";
Submitted (AUG-1999) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: Receptor for the cytotoxic ligand TMFSF10/TRAIL. The adaptor molecule FADD recruits caspase-8 to the activated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   similarity).
SUBCELLULAR LOCATION: Type I membrane protein.
TISSUE SPECIFICITY: Highly expressed in heart, lung and kidney INDUCTION: TWRESTIOB is regulated by the tumor suppressor p53.
SIMILARITY: CONTAINS 3 TWER-CYS REPEATS.
SIMILARITY: CONTAINS 1 DEATH DOMAIN.

Tumor necrosis factor receptor superfamily member 10A precursor (Death receptor 4) (TNF-related apoptosis-inducing ligand receptor 1) (TRAIL receptor 1) (TRAIL-RI).
TURPESFIOA ON DR4 ON TRAIL-RI ON APO2.
Homo sapiens (Human).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     -i. SUBGUIT: Can interact with TRADD and RIP.
-i. SUBCELLULAR LOCATION: Type I membrane protein.
-i. TISSUE SPECIFICITY: Widely expressed. High levels are found in spleen, peripheral blood leukocytes, small intestine and thymus, but also in K562 erythroleukemia cells, MCF7 breast carcinoma cells and activated T-cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Chaudhary P.M., Eby M., Jasmin A., Bookwalter A., Murray J., Hood L. "Death receptor 5, a new member of the TNFR family, and DR4 induce FADD-dependent apoptosis and activate the NF-kappaB pathway."; Immunity 7:821-830(1997).

- FUNCTION: Receptor for the cytotoxic ligand TNFSF10/TRAIL. The adaptor molecule FADD recruits caspase-8 to the activated receptor. The resulting death-inducing signaling complex (DISC) performs caspase-8 proteolytic activation which initiates the subsequent cascade of caspases (aspartate-specific cysteine proteases) mediating apoptosis. Promotes the activation of NF-
                                                                                                                                                                                     Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;

Pan G., Mao W., Risser P.;

"Characterization of SOB, a member of the TNFR family.";

Submitted (JUL_2001) to the EMBL/GenBank/DDBJ databases.

-! SUBCELUDLAR LOCATION: Type II membrane protein (Potential).

-! TISSUE SPECIFICITY: Ubiquitous.

-! SIMILARITY: CONTAINS 3 TNFR-CYS REPEATS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                N-LINKED (GLCNAC. . .) "Characterization of the MRC OX40 antigen of activated CD4 positive I lymbhocytes -- a molecule related to nerve growth factor receptor.", EMBO J. 9:1063-1068(1990).
-- FUNCTION: Receptor for INFSF4/OX40L/GP34.
-- SUBCELLUIAR LOCATION: Type I membrane protein.
-- ISSUE SPECIFICITY: ACTIVATED T-CELLS.
-- SIMILARITY: CONTAINS 4 INFR-CYS REPEATS.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  COLON, INTESTINE, ABUNDANTIA ELSOLARD-1A (SHOWN HERE), ALTERNATIVE PRODUCTS: 12 ISOFORMS; 1/WSL-1/LARD-1A (SHOWN HERE), 2/LARD-1B, 3/WSL-S1/LARD-3, 4/WSL-28/LARD-2, 5/LARD-4/LARD-11, 6/LARD-5, 7/LARD-6, 8/LARD-7, 9/LARD-8, 10/LARD-9, 11/BETA AND 12/BETA SOLUBLE, ARE PRODUCED BY ALTERNATIVE SPLICING. TISSUE SPECIFICITY: ABUNDANTLY EXPRESSED IN THYMOCYTES AND LYMPHOCYTES. DECTED IN LYMPHOCYTE-RICH TISSUES SUCH AS THYMUS, COLON, INTESTINE, AND SPLEEN. ALSO FOUND IN THE PROSTATE. PTM: GLYCOSYLATED (PROBABLE).
SIMILARITY: CONTAINS 4 THRR-CYS REPEATS.
SIMILARITY: CONTAINS 1 DEATH DOMAIN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           SUBCELLULAR LOCATION: Type I membrane protein (isoforms 1, 2, 9 and 11); Secreted (isoforms 3, 4, 5, 6, 7, 8, 10 and 12)

THESELLY. NECEPOLATE ALTON AND CALLE AND LANGE THE SERILLY. The adaptor molecule FRADD recruits caspase-8 to the activated receptor. The resulting death-inducing signaling complex (DISC) performs caspase-8 proteclytic activation which initiates the subsequent cascade of caspases (aspartate-specific cysteine proteases) mediating apoptosis (By similarity).

-!-SUBUNIT: THE BINDING TO THE EXPRACELLUAR DOMAIN OF THRI LEADS TO HOWOTRIMERIZATION. ONCE AGGREGATED THE RECEPTORS DEATH DOMAINS PROVIDE A NOVEL MOLECULAR INTERFACE THAT INTERACTS SPECIFICALLY WITH THE DEATH DOMAIN OF TRADD. VARIOUS TRADD. INTERACTS SPECIFICALLY PROTEINS SUCH AS TRASS, RIP AND POSSIBLY FADD, ARE RECRUITED TO THERL COMPLEX BY THEIR ASSOCIATION WITH TRADD. THIS COMPLEX ACTIVATES AT LEAST TWO DISTINCT SIGNALING CASCADES, APOPTOSIS AND NF-KAPPA B SIGNALING (BY SIMILARITY).

-!-SUBLILLARITY: CONTAINS 4 THERE, VER REPEATS.
                                                                                                                                                                                                                                                                            This SWISS-PROT entry is copyright. Preparation of soluble membrane proteins - for their use in antibody production for the treatment and prevention of related diseases
                                                                                                                                                                                                                                                                                                                                                                      AAR78606 (human Fas protein) is encoded by the plasmid pF58 which contains hFas cDNA. The plasmid was used in the construction of an expression vector for the proden. Of recombinant soluble membrane proteins. The proteins can be used in antibody prodn. for the treatment and prevention of related diseases.
                                                                                                                                                                                                                                                                                                                                           Example 1; Pages 15-17; 51pp; Japanese.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The Fas antigen is implicated in apoptosis. A cDNA clone encoding the antigen was isolated (pF58) and the amino acid sequence of Fas was deduced from it. The mature protein has a calculated mol.wt. of member of the NGFR/TWFR family of cell-surface membrane proteins. The inventors claim a protein comprising at least the extracellular domain of Fas antigen.
                                                                                                                                                                                                              DNA encoding human cell surface antigen - used to clarify apoptosis mechanism of various types of cell, and to prepare monoclonal antibodies that react with tumour cells expressing Fas

angioimmunoblastic lymphadenopathy; AILD.

```
This sequence represents the sequence for the human Fas antigen contained within the plasmid pcEV4/hFas. The soluble Fas antigen is included in the immunoassay kit of the invention. The kit is for the assay of soluble Fas antigen and contains an immobilised anti-soluble Fas monoclonal antibody, as well as the standard soluble Fas antigen represented by this sequence. The assay is simple and has high accuracy, high sensitivity, and is capable of assaying a number of different specimens at the same time. The immunoassay is used on biological samples (such as serum) and is useful for diagnosis of autoimmune diseases such as rheumatoid arthritis or systemic lupus erythematosus
                                                                                                                                                                                                                                            Fas; antigen; immunoassay; monoclonal antibody; autoimmune disease; SLE; rheumatoid arthritis; serum; systemic lupus erythematosus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               61 KPCPPGERKARDCTVNGDEPDCVPCQEGKEYTDKAHFSSKCRRCRLCDEGHGLEVEINCT 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                A cDNA clone (AAT34526) codes for a membrane receptor-like protein, Fas antigen (AAR99681). It was isolated from cDNA derived from the peripheral blood monouclear cells of systemic lupus erythematosus (SLE) and angioimmunoblastic lymphadenopathy (ALLD) patients. 4 Soluble variants (AAR99682-85) were identified of the Fas antigen. These arose by alternative splicing of Fas gene transscripts. The Fas variants were present at higher levels in SLE and ALLD patients than the non-soluble Fas antigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1 MIGIWTLLPLVLTSVARLSSKSVNAQVTDINSKGLELRKTVTTVETQNLEGLHHDGQFCH

       Human; Fas antigen; derivative; apoptosis regulation; gene therapy; treatment; diabetes; arthritis; lupus; hepatitis; influenza; HIV;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Fas antigen derivative containing modified extracellular region - has low antigenicity, promotes apoptosis and is useful in treatment of viral and other diseases
                                                                                  The present sequence was used in the development of novel Fas antigen derivatives, which contain a Fas antigen extracellular region lacking one or more amino acid residues in the region from the amino-terminal to (but excluding) the lst cysteine residue (preferably at least 29 residues are deleted). The derivatives are effective regulators of apoptosis and can be used (either by administration of the polypeptide, or by the use of the coding DNA in gene therapy) to treat a range of diseases, e.g. diabetes, arthritis, lupus and in particular viral diseases

                                                                                                                                     The present sequence represents a Fas protein sequence used in the method of the invention. The method is concerned with reducing depletion of activated Fas expressing CD8+ T-Imphocyte killer (FR) cells in an immune cell population which also comprises of Fas-ligand (FasL)-expressing activated CD4+ cells. It involves contacting this immune cell population which would interfere with the call population protein) which would interfere with the interaction between Fas and FasL. Therefore, the method is useful for identifying suitable agents which can reduce depletion of activated Fas-expressing CD8+ TK cells in immune cell populations. Also claimed is the use of the agent in the manufacture of therapeutic compositions. Apoptosis of lymphocytes can be triggered by the interfering with this interaction, the method described and its preparations can prevent apoptosis of CD8+ TK lymphocytes caused by expression of FasL on activated CD4+ cells. Such FasL-expressing activated CD4+ cells are especially the result of CD4+ cell infection with an immunodeficiency virus e.g. human immunodeficiency virus (HIV) or simian immunodeficiency virus e.g. human immunodeficiency virus (HIV) or simian immunodeficiency virus (SIV). The claimed prevention of apoptosis may then allow maintenance/regeneration of cytotoxia T lymphocyte (CTL) activity the agence of the parament (prophylactic and/or therapeutic) of immunodeficiency in an agent of immunodeficiency of immunodeficiency of immunodeficiency of immunodeficiency of immunodeficiency and immunodeficiency of immunodeficiency or immunications or immunodeficiency or immunodeficiency or immunodeficiency or immunodeficiency or immunodefi
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

Antisense oligonucleotides for treating hepatitis and colon, liver or lung cancer are inhibitors of Fas, Fas ligand or Fas associated protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             -untranslated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence represents human Fas (Apo-1). The specification describes antisense compounds which are targeted to the 5'-untranslate region, translational start site, translational termination region or 3'-untranslated region of nucleic acid molecules encoding Fas, Fas ligand (Fasi), or Fap-1 (Fas associated protein 1, protein tyrosine phosphatase). The antisense compounds are used to inhibit the expression of Fas, Fasi or Fap-1 in cells or tissues. They are used to treat autoimmune or inflammatory diseases such as hepatitis. They can also be used to treat cancer, especially colon, liver or lung
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       KPCPPGERKARDCTVNGDEPDCVPCQEGKEYTDKAHFSSKCRRCRLCDEGHGLEVEINCT 120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      RTQNTKCRCKPNFFCNSTVCEHCDPCTKCEHGIIKECTLTSNTKCKEEGSRSNLGWLCLL 180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       LLPIPLIVWVKRKEVQKTCRKHRKENQGSHESPTLNPETVAINLSDVDLSKYITTIAGVM 240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               TLSQVKGFVRKNGVNEAKIDEIKNDNVQDTAEQKVQLLRNWHQLHGKKEAYDTLIKDLKK 300

                                                                                                                                                                                                                                                                                                                                                                                                                    A pure or recombinant polypeptide which binds to a polyclonal antibody specific for the mature Uil44 is useful for screening molecules which block induction of apoptosis or interfere with antiapoptotic activity. The polypeptide is also useful for modulating apoptosis and useful in treatment of conditions associated with abnormal physiology or equilation of viral infection and replication. At least five different death receptors are known, which include the CD95 (Fas/APO-1), the TNF receptor-1, TNF receptor apoptosis-mediated protein (TRAMP), death receptor-6 (DR 6), and TNF-related apoptosis-inducing ligand (TRAIL) receptors 1, 2 and 4.
                                                                                                                                                                                                                                                                                                                                              Purified or recombinant polypeptide for modulating apoptosis comprises a sequence which binds to an antibody specific for UL144 or its

The present invention describes the human TRID protein (tumour necrosis factor (TNF) related apoptosis inducing ligand (TRAIL) receptor without intracellular domain, also referred to as tumour necrosis factor receptor 5 (TNRP-5 or TRE)). TRID has cytostatic, immunosuppressive, nootropic, neuroprotective, antiviral, antiinflammatory, anticonvulsant, antiparastic, cardiant, anti-HIV, antiparkinsonian and vasotropic activities, and can be used in gene therapy. The TRID polynucleotides are useful for detecting complementary polynucleotides. TRID proteins and polynucleotides are useful in the treatment of tumours, resistance to
                                                                                                                                                                                                                                                                                                                                                                                         parasite, bacteria and viruse, restencists and graft versus host disease. They are also useful for inducing proliferation of T-cells, endothelial cells and certain haematopoietic cells, to regulate antiviral responses and to prevent certain autoimmune diseases after stimulation of TRID by polypeptides are useful for treating and/or preventing diseases which bind TRID polypeptides are useful for treating and/or preventing diseases sociated with increased or decreased apoptotic cell death. The TRID polypurclectides, proteins, antibodies, agonists and antagonists are useful in the diagnosis, treatment or prevention of: (a) cancer; (b) autoimmune disorders; (c) diseases associated with increased apoptosis; (d) cardiovascular disorders; and (e) viral infection. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             present sequence represents a tumour necrosis factor receptor used in comparison with TRID in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Length 335;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   100.0%; Score 1804; DB 22;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This sequence represents a human tumour necrosis factor receptor-1 which is used in a method resulting in the isolation of a human death domain containing receptor 4, DR4. DR4 agonists are used to increase apoptosis induced by tumour necrosis factor (TNP)-family ligands, e.g. in cases of cancer, autoimmune disease, viral or other infections, inflammation, graft vs. host disease, acute or chronic graft rejection. Antagonists of BR4 are used to inhibit such apoptosis, e.g. in cases of acquired immune deficiency syndrome, neurodegenerative disease, myelodysplastic syndrome, ischemali injury, toxin-induced liver damage, septic shock, cachexia and anorexia, also a wide range of inflammatory conditions. DR4 of fragments

```
The present invention provides the protein and coding sequences for two death domain containing receptors, designated DR3 and DR3-VI. These receptors are involved in apoptosis, and the sequences given can be used in the treatment of cancers, infections, cardiovascular disorders such arrhythmias, ischaemia, aneurysms, arterial occlusive diseases, embolisms and congenital heart defects, neurodegenerative diseases, embolisms Alzhehmer's and Parkinson's diseases, autoimmune disease such as multiple sclerosis, arthritis, diabetes, Graves' disease, asthma and psoriasis, and to promote anglogenesis and wound healing.
                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              antilnflammatory; anti-HTV; antiparkinsonian; nootropic; cardiant; vasotropic; antiallergic; antidiabetic; vulnerary; ophthalmological; antibacrerial; antidinagal; antiparasitic; gene therapy; tumour necrosis factor receptor; cancer; leukaemia; autoimmune disorder; apoptosis; cardiovascular disorder; inflammatory disease; wound; infection; neurological disease; Fas receptor; protein coordinate data.

                                                                                                                                                                                                                                             The present sequence is given in a specification relating to an isolated nucleic acid encoding a human tumour necrosis factor receptor TRIO. The TRIO polymorelectide, polymorphide, antibodies, agonists and antagonists are useful in the diagnosis, treatment or prevention of cancer, such as breast and ovarian cancer and leukaemia; autoimmune disorders such as multiple sclerosis, Crohn's disease and graft versus host disease; diseases associated with increased apoptosis such as AIDS, allowed as limb ischaemia and congenital heart defects; inflammatory such as limb ischaemia and congenital heart defects; inflammatory incovascularisation, e.g. diabetic rethinopathy; infectious diseases such as viral, fungal and parasitic infectious diseases such as wiral, bacterial, fungal and parasitic infections; and neurological diseases such as amyotrophic lateral sclerosis.
                                                                                                                                                Nucleic acid encoding a tumor necrosis factor receptor 10, useful in the diagnosis, treatment or prevention of cancer, autoimmune disorders, and disorders associated with apoptosis

A natural, soluble Fas antigen variant (AAR99682), designated Fas dell, and other Fas variants (AAR99683-85) are derived by alternative splicing of Fas gene transcripts. A CDNA clone (AAT9527) coding for the variant was obtd. from human peripheral blood monouclear cells. The Fas dell variant lacks the transmembrane domain of insoluble Fas antigen (AAR99681). Recombinant dell variant, or fragments of it, can be expressed in prokaryotic or eukaryotic (e.g. COS) cells. Detection of increased levels of soluble forms of Fas antigen can be used to diagnose autoimmune diseases, esp. systemic lupus erythematosus and angioimmunoblastic lymphadenopathy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         61 KPCPPGERKARDCTVNGDEPDCVPCQEGKEYTDKAHFSSKCRRCRLCDEGHGLEVEINCT 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                  mRNA was obtd. from human lymphocytes and PCR was used to make CDNA specific for Fas-delta-TM (1.e. Fas lacking the transmembrane region) mRNA. The PCR product was ligated into pBluescript and the recombinant plasmid was used to transfect E. coli DH5-alpha cells. Insert sequence of pBluescript-Fas-delta-TM encoded the protein given in AAR76238.

                                                              This present sequence is a soluble Fas receptor. The invention provides a method for inhibiting a proinflammatory response in a cell mixture by administering an immunosuppressive agent which inhibits the proinflammatory activity of Fas ligand (Fasl). In some embodiments, an Fasi is coadministered with the immunosuppressive agent, and the cell mixture comprises neutrophil cells. The method can be practised in vitro, ex vivo or in vivo. Suitable immunosuppressive agents include antisense molecules that inhibit
                                                                                                                                                                                                                                                                                                                               Fas receptor; Fas ligand; FasL; proinflammatory; immunosuppressive; graft versus host disease; autoimmune disease; psorlaais; rheumatoid arthritis; systemic lupus erythematosus; gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Inhibition of proinflammatory responses – using an agent which modulates FasL stimulation, used for treating graft versus host disease or autoimmune disease

                                                                                                                                                                                                                                                                                                9
                                                                                                                                                                                                                                                                                                                            9
endogenous FasL expression, soluble Fas receptors or variants, ribozymes that inhibit the endogenous expression of FasL, drugs that inhibit FasL signalling, agents that induce the endogenous expression of transforming growth factor (TGF)-beta, and polynucleotides coding for an immunosuppressive agent such as TGF-beta. The method can be used for treating diseases associated with an undesired FasL-mediated proinflammatory response, e.g.
                                                                                                                                                                                                                                                                                       1 MLGIWTLLPLVLTSVARLSSKSVNAQVTDINSKGLELRKTVTTVETQNLEGLHHDGQFCH
                                                                                                                                                                                                                                                                                                           graft versus host disease, or an autoimmune disease such as systemic lupus erythematosus, rheumatoid arthritis and psoriasis. The invention also provides a method for identifying agents which modulate FasL stimulation of a proinflammatory response.
                                                                                                                                                                                                                                                                                                                                                                                                                                    21;
